Practical 1: Write a program in Console application and windows application in C# to check whether the number is prime or not.

```
namespace First_project
{
   class Program
   {
      static void Main(string[] args)
      {
         int number;
         bool isPrime = true;

         Console.WriteLine("Enter a number: ");
         number = Convert.ToInt32(Console.ReadLine());

         if (number <= 1)
         {
            isPrime=false;
         }
         for (int j = 2; j < number/2; j++)
         {
            if (number % j == 0)
            {
               isPrime = false;
            }
         }
         if (isPrime){
            Console.WriteLine(number +" is a prime number");
         }
         else
         {
            Console.WriteLine(number +" is not Prime Number");
         }
      }
   }
}
```

OUTPUT:-

```
Enter a number:
11
11 is a prime number
```

Practical 2: Write a program in Console application and windows application in C# to find whether a number is Armstrong or not.

```
using System;
namespace Practice
{
    class Armgstrong
      {
            public static void Main(string[] args)
             {
               Console.Write("Enter a number=");
               int num = int.Parse(Console.ReadLine());
               int  rem, sum = 0;
               int num1 = num;
               while (num1 > 0)
               {
                    rem = num1 % 10;
                    sum = sum + (rem * rem * rem);
                    num1 /= 10;
                }
                if (num == sum)
                {
                    Console.WriteLine(num + " is Palindrome number");
                }
                else
                {
                    Console.WriteLine(num+" is not Palindrome number");
                }
             }
      }
}
```

OUTPUT:

```
Enter a number=371
371 is Palindrome number
```

Practical 3: Write a program in Console application in C# to demonstrate the difference between prefix and postfix forms in ++.

```
namespace Practice
{
   public class  PrePostDemo
   {
      public static void Main()
      {
         int x, y;
         int i;
         x = 1;
         Console.WriteLine("Series generated using Postfix y= x + x++");
         for (i = 0; i < 10; i++)
         {
            y = x + x++;
            Console.WriteLine(y + " "); //Postfix
         }
         Console.WriteLine();

         x=1;
               Console.WriteLine("Series generated using Prefix y= x + x++");
                     for (i = 0; i < 10; i++)
                     {
                           y = x + ++x;
                           Console.WriteLine(y + " "); //Prefix
                     }
                     Console.WriteLine();
               }
   }
}
```

OUTPUT:

```
Series generated using Postfix y= x + x++
2
4
6
8
10
12
14
16
18
20

Series generated using Prefix y= x + x++
3
5
7
9
11
13
15
17
19
21
```
